HEPB • HEPC • NAFLD
FIBROSIS • CIRRHOSIS
NASH • LIVER DISEASE

WHY FIBROSCAN®

FibroScan® examination may be warranted for any of the following conditions:

- Hepatitis B or Hepatitis C
- Fatty liver disease (NAFLD and NASH)
- Alcohol related liver disease
- Obesity related liver disease (non-alcoholic fatty liver disease)
- Liver disease related to Autoimmune Hepatitis, Wilson's Disease and Hemochromatosis
- Other types of chronic liver disease

Better than a biopsy, the FibroScan® probe sends a wave through a larger section of liver than is possible to test with a biopsy and gives a clearer picture of the disease state affecting the largest portion of the liver.

Most insurance companies are covering this non-invasive procedure.

FIBROSCAN® READING

The Reading may be used to:

- Examine the existing degree of liver damage and scarring (Fibrosis)
- Monitor disease progression or regression via serial measurements
- Guide prognosis and further management, including treatment

WHAT DO THE RESULTS MEAN?

- Between 90 to 95% of healthy people without liver disease will have a liver fibrosis score measurement <7.0 kPa (median is 5.3 kPa).

The FibroScan report is provided to the referring physician within 72 hours of the procedure.

HOW DO I ORDER THIS SCAN?

Fax the referral form to FibroScan scheduler at 941-256-2120, or call 941-366-0461 to schedule an appointment.

NEW, quick and painless FDA approved alternative to Liver Biopsy with new Fibroscan® technology
